TITLE: The Covariance in Approximation to  $\xi$  in Linear, Combined,  
Automatically Controlled Systems. (Russian)  
PERIODICAL Doklady Akademii Nauk SSSR, 1957, Vol 112, Nr 2, pp 253-256  
(U.S.S.R.)  
Received: 3 / 1957 Reviewed: 4 / 1957

ABSTRACT: The present work investigates this covariance in approximation to  $\xi$  which is due to the approximate satisfaction of the conditions of absolute covariance. A combined automatically controlled system, the structural scheme of which is illustrated by a drawing, is investigated.  
 $x(t)$  and  $x_{cov}(t)$  denote the processes which are due to a disturbance  $f(t)$  in an automatically controllable system in the case of a control based on the system of deviation and/or on the system of deviation and disturbance respectively:  
$$x(t) = L^{-1} \left\{ (N_1 / \Delta N) f(s) \right\}, \quad x_{cov}(t) = L^{-1} \left\{ ((N_1 - N_2) / \Delta N) f(s) \right\} f(s).$$
Here  $\Delta N$  denotes the characteristic polynomial of the systems,  $N_1$  and  $N_2$  the corresponding polynomials with the order  $k$  and  $l$ ,  $L$  - the LAPLACE-like representation of the inverse transformation,  $f(s)$  - the LAPLACE-like representation of the disturbance  $f(t)$ : it applies that  $N_1 = b_0 + b_1 s + b_2 s^2 + \dots + b_k s^k$

The Covariance in Approximation to  $\mathcal{E}$  in Linear, Combined, Automatically Controlled Systems. (Russian)

and  $N_2 = \bar{a}_0 + \bar{a}_1 s + \bar{a}_2 s^2 + \dots + \bar{a}_1 s^1$ . Similar to the conditions of absolute covariance, the dependence of the minimizing of  $x_{\text{cov}}(t)$  on the coefficients  $a_i$  or  $a_i = b_i - \bar{a}_i$  ( $b_i$  is assumed) must be determined. By using the theorem concerning the behavior of the functions with respect to the expression  $x_{\text{cov}}(t)$  the following correlation is found between the processes in the case of control according to the principle of deflection and according to the principle of deflection and disturbance:  $x_{\text{cov}}(t) = \int_0^t \Phi(\tau)x(t - \tau)d\tau$ . This correlation is written down also in a different form. The coefficients occurring in this connection are computed immediately from the parameters of the open and of the closed cycle of the system. In the case of the combined systems for automatic control these coefficients characterize the measure of covariance of these systems. Several peculiarities of the various systems are individually mentioned.

Next, the covariance in approximation to  $\mathcal{E}$  of the linear

Card 2/3

PA - 2100

The Covariance in Approximation to  $\xi$  in Linear, Combined,  
Automatically Controlled Systems. (Russian)

systems investigated here are studied within a finite interval of time  $t$  ( $0 < t < t_1$ ). The "pulse function" of the system can be represented in form of a polynomial with respect to  $t$

without a free term:  $k(t) = \sum_{n=1}^{\infty} a_n t^n$ . The definite expression

for  $x_{cov}(t)$  is explicitly given and developed in series according to  $t$ .

The conditions of covariance in approximation to  $\xi$  characterize the measure of undisturbedness of the system in dependence on the efficiency of coupling and the sufficiently small number of necessary effects. The conditions found here extend the range of applicability of the ideas of covariance in combined systems for automatic control.

ULANOV, G.M.

AUTHOR: PETROV, V.V., ULANOV, G.M. PA - 2106  
TITLE: The Similarity of Sliding, Vibrational and Optimum Conditions  
of Motion in Servomechanisms (Russian).  
PERIODICAL: Doklady Akademii Nauk SSSR, 1957, Vol 112, Nr 3, pp 394-397  
(U.S.S.R.)  
Received: 3 / 1957                                  Reviewed: 4 / 1957

ABSTRACT: The present work deals with the similarity of sliding, vibrational, and optimum kinds of operation in servomechanisms. It is shown that with the aid of these modes of operation the optimum kind of motion of servomechanisms can be realized. By vibration-like behavior of the servomechanism its motion in the case of the presence of a vibration contour with control mechanism (relay) is here understood. By instantaneous kind of operation an instantaneous transition process is understood, which, under existing circumstances, develops within the shortest possible time. The similarity between these three kinds of operation consists in a nearly periodic motion of the relay with a frequency depending on the parameters of the servomechanism. Also the shape of couplings and the intensity of disturbances (detuning) plays a part.

A drawing illustrates the structural schemata of the system of automatic control for the classical problem as well as the

Card 1/3

PA - 2106

The Similarity of Sliding, vibrational, and optimum conditions  
of Motion in Servomechanisms.

structural schemata of a servomechanism with velocity-depend-  
ent and firm back-coupling and of a servomechanism with two  
kinds of oscillatory circuits. The oscillation equations of  
the various schematas are given.

Some conclusions:

- 1) In the case of an indefinite relay function  $\Phi$  the system continuous to move in accordance with a certain deviation from the band, which, however, never exceeds the limit of the path, further within the band  $F = \sigma_1$  with variable decreasing frequency of the switching device. The steady state of the system is a process of self-oscillation.
- 2) In the case of definite characteristic  $\Phi$  the system also moves further in accordance with a certain deviation along the switching-over line  $F = 0$ . If  $\Phi$  is the function of a linear argument, the motion of the system is linearized within the domain along the switching-over line. Its phase-trajectory is then a straight line determined by argument  $F$ , and the order of the equations describing the system is diminished by at least 1.
- 3) In the case of a nonlinear argument  $\Phi$ , in which case  $F(y,x) = \Psi_1(y,x)$  with  $\Psi_1(0,0) = 0$  applies, the slizing manner of motion is identical with the optimum. The optimum process

Card 2/3

The Similarity of Sliding, Vibrational, and Optimum Conditions  
of Motion in Servomechanisms.

may therefore be considered to be a limiting- and special  
case of the sliding operation with the switching-over fre-  
quency of zero. Therefore optimum processes can be realized  
with a definite degree of accuracy by a corresponding selection  
of the parameters of the servomechanisms.

TITLE: On a Generalization of the Deflection accumulation Theory and  
its Use for Determining Autooscillations in Generators. (Ob odnom  
obobshchenii teorii nakopleniya otkloneniya i prilozheniya eye k  
opredeleniyu avtokolebaniy v generatorakh, Russian).

PERIODICAL: Doklady Akademii Nauk SSSR, 1957, Vol 113, Nr 1, pp 54 - 57  
(U.S.S.R.)

Received: 5 / 1957

Reviewed: 6 / 1957

ABSTRACT: The present work computes the accumulated deflections of compound  
functions of a regulatable quantity on the assumption that the  
disturbance  $f(t)$  is restricted with respect to the modulus or that  
the modulus of any disturbance is restricted. Furthermore, a graphical  
analytical method for the construction of the diagram of the accu-  
mulation of deflections is worked out. The steady linear system of  
automatic control may be described by the following equation:

$\phi(s) L\{x(t)\} = g(s) L\{f(t)\}$ . Here  $\phi(s)$  and  $g(s)$  denote polynomials with  
respect to  $s$  ( $s$  denotes the Laplace operator),  $L\{x(t)\}$  and  $L\{f(t)\}$  -  
Laplace transformations of  $x(t)$  and  $f(t)$  respectively.  
The author examines the problem of the accumulation of functions  
of a regulatable quantity of the type

$$x(t) = a_0 x(t) + a_1 \dot{x}(t) + \dots + a_k \ddot{x}(t) + b_0 \int_0^t x(t) dt + \dots + \int_0^t \dots \int_0^t x(t) dt,$$

$k < m - n$

Card 1/2

On a Generalization of the Deflection Accumulation PA - 2646  
Theory and its Use for Determining Autooscillations in Generators

for the case in which a disturbance  $f(t) \geq 1$  restricted according to the modulus acts upon the system mentioned above. The Laplace transformation of  $X(t)$  is written down. The accumulation of the function  $X(t)$  for the restricted modulus  $f(t)$  is determined by  $|f(t - T)| = 1$ , sign  $H(t)$  " signf( $t - T$ ) for the entire time interval  $0 \leq t$ . A formula is also given for the maximum accumulated value of  $X(t)$ .

The diagram of the accumulation of deflections  $X_{\max}(t)$  is easily constructed on the basis of the "summarized transition function"  $H(t)$  the curve found is in this case monotonous. Next, a common feature shared by self oscillations and the accumulation process of deflections in certain generators is shown, and the amplitude and frequency of the resulting oscillations is determined on the basis of the analysis of the accumulation process of deflections.

PHASE I BOOK EXPLOITATION SOV/3317

Moscow. Vyssheye tekhnicheskoye uchilishche. Kafedry "Avtomatika i telemekhanika"

Sistemy avtomaticheskogo regulirovaniya i upravleniya; nekotoryye voprosy teorii i tekhniki (Automatic Regulating and Control Systems; Some Problems in Theory and Technology) Moscow, Mashgiz, 1959. 166 p. (Series: Its Trudy, sbornik no. 97) 7,600 copies printed.

Ed.: V.K. Titov, Candidate of Technical Sciences; Tech. Ed.: Z.I. Chernova;  
Managing Ed. for Literature on Machine Building and Instrument Making (Mashgiz):  
N.V. Pokrovskiy, Engineer.

PURPOSE: The book is intended for teachers in schools of higher education, and for engineers and technicians engaged in problems of automation.

COVERAGE: This collection contains articles on the theory and technique of automatic regulation and control. The problems discussed concern calculation of optimum parameters of low-power servomechanisms, correction of a-c systems and systems of automatic regulation with a delay unit, and the construction of self-adjusting a-c systems. Several methods of improving the dynamic properties of servomechanisms, and methods of approximate investigation of pulse servo-

Card 1/7

Automatic Regulating and Control (Cont.)

SOV/3317

mechanisms, are also explained. Some considerations regarding possible ways of automating butt welding in a random direction are presented. The authors of this collection are all instructors in the department of "Automation and Remote Control" at MVTU imeni Bauman. The articles are based on scientific research work conducted by the department during the last five years. Some personalities are mentioned in each article. References are given after each article.

TABLE OF CONTENTS:

Ulanov, G.M., Doctor of Technical Sciences. Development of the Invariancy Principle and of the Theory of Combined Systems of Regulation and Control 5

According to the author, the theory of invariancy constitutes the basis of the theory of combined automatic systems which depend on two principles:

- 1) regulation and control as a function of deviation;
- 2) regulation and control as a function of load. Mathematical problems of invariancy were developed in the Soviet Union by N.N. Luzin and P.I. Kuznetsov in 1945-1946. In 1948 Academician V.S. Kulebakin established conditions of invariancy with an accuracy up to the free component. Professors A.G. Ivakhnenko,

Card 2/7

Automatic Regulating and Control (Cont.)

SOV/3317

A.J. Kukhtenko and other Ukrainian scientists contributed much to the advancement of the theory and methods of developing combined systems of automatic regulation and control. A tendency to unite the problems of combined systems and of self-adjusting systems appears in the works of V.V. Solodovnikov and A.M. Batkov (1956). The author summarizes the basic ideas of the Soviet scientists on the above problems.

## Bibliography

14

Shramko, L.S., Candidate of Technical Sciences. Problem of Self-adjusting Systems

15

The author investigates some a-c systems which develop an error signal of the type  $U_e(t) \cos\omega_0 t$ . This signal, amplified and converted accordingly, is used for the control of certain actuating units (frequently, two-phase induction motors). There are two ways of converting this error signal:

- 1) with demodulation preceding the conversion of the a-c signal;
- 2) without intermediate demodulation

The author considers systems of the second type the more advantageous because of the absence of additional demodulating and modulating devices.

Card 3/7

Automatic Regulating and Control (Cont.)

SOV/3317

He analyzes these systems, describes certain difficulties in their operation (e.g., those due to variations in frequency of the power supply), and concludes that further research on self-adjusting a-c systems should provide useful material for solving the general problem of self-adjusting systems.

SOV/3317

Guzenko, A.I., Candidate of Technical Sciences. Designing Single-cycle  
Magnetic Power Amplifiers

85

This article presents a further development of the methods of calculating parameters of magnetic amplifiers containing an external feedback and a bias circuit which were suggested in the two articles given as references. The author presents a practical method of designing a single-cycle magnetic amplifier with a bias and an external feedback assembled from three-rod and toroidal cores.

Bibliography

96

Pyatin, Yu.M., Candidate of Technical Sciences. Rational Selection of Parameters of Measuring Bridge Circuits

97

The author demonstrates that matching of bridge parameters with the resistance of the data unit of a Wheatstone measuring bridge system results in a relative and not an absolute power maximum in the measuring device. By this he also shows that K.B. Karandeyev's conclusion (Ref.1) on the inconsistency of Heaviside's optimum conditions is erroneous. The author states that his findings apply to any electric circuit.

Bibliography

PURPOSE: This collection of papers is intended for engineers and other specialists  
working in various fields of automation.

CONTENTS: The collection includes reports and papers presented at the Conference  
on the Theory of Insurance and Its Applications to Automatic Devices which  
was held by the Otdelenie radioelektronika i tekhnicheskikh sistem (Department of Technical Sci-  
ences) of the Akademicheskii inovatsionnyi tsentr. It was convened in Leningrad October 16 -  
20, 1958. The papers presented are concerned with high-quality automatic con-  
trol systems designed on the basis of compensation for the effects of distur-  
bances or maintaining the insurance of the quality to be required with re-  
spect to the disturbances acting on the system. The reports treat the physical  
and mathematical foundations of insurance in automatic control systems.  
They also consider methods for developing and calculating automatic systems and pro-  
grams connected with specific cases of practical applications of compensation  
in various automatic systems. On the basis of these reports it was established  
by the Conference that, by utilization of the conditions of compensation and the  
principle of insurance, it is possible to produce automatic systems and various  
arrangements which are very perfect from the viewpoint of quality of the regu-  
lation and control processes, stability, simplicity of construction, and reliabil-  
ity of operation. The following members of the Kiev Seminar on Automatic Con-  
trol are mentioned as organizers of the conference: A.I. Kukhtenko, A.G. Ivash-  
chenko, Yu.D. Kondratenko, M.M. Chumakov, I.M. Kurnosov, and  
G.I. Chumakov. References accompany each article.

**Purposes:** This book is intended for engineering and scientific personnel engaged in instruction or review of various concerned procedures.

**CONTENTS.**

**Coverage:** The authors explain the principle of operation of automatic control elements and servomechanisms. They also discuss typical automatic control circuits and present equations of motion and static and dynamic characteristics of automatic control elements. They describe sensing elements, amplifiers, control elements and transducers. The book contains Sections I, II, III, and IV of Part I, Volume II - Principles of Automatic Control. The writing persons participated in writing the present work: D. A. Breznevich, Candidate of Technical Sciences, Paragraph 1-6 and 14 of Chapter III; and L. A. Gulyaeva, Doctor of Technical Sciences, Paragraph 1-6 and 14 of Chapter IV.

**Editor:** V. A. 36.	pH - measuring elements	105
37.	Gas analyzers	105
38.	Pyroelectric sensing elements	108
39.	Hypersonic sensing elements	109
Ch. III.	Oscilloscope Sensing Elements and Accelerometers	111
1.	General information on gyro sensing elements	111
2.	Gyro variometers	117
3.	Course-indicating gyro systems	131
4.	Accelerometers	143
Ch. IV.	Transducers	157
1.	Contact transducers	157
2.	Potentiometers	157
3.	Displacement transducers	157
4.	Electrically-excited transducers	173
5.	Inductive transducers	175
6.	Photoelectric transducers	176
7.	Capacitive transducers	176
8.	Inductance transducers	179
9.	General information on seylays. Operation of seylays with longitudinal and transverse components of current in the secondary circuit	182
10.	Operation of seylays with a number of parallel-connected receivers	189
11.	Classification of static accuracy of seylays	197
12.	Operation of seylays with synchro control trans-formers	198
13.	Operation of seylays with synchro control trans-formers	200
14.	Relays and magnetoids	213
Ch. V.	Vacuum-tube and Semiconductor Modulators and Demodulators	216
1.	Function and basic characteristics of modulators and demodulators	216
2.	Modulators	221
3.	Demodulators	245
	SECTION II. AMPLIFIERS	258
Ch. VI.	Vacuum-tube and Thyatron Amplifiers	258
1.	Vacuum-tube d-c amplifiers	258
2.	A-c Voltage amplifiers	259
3.	A-c Power amplifiers	259
4.	Transistor amplifiers	260
5.	Thyatron amplifiers	262
Ch. VII.	Magnetic Amplifiers	266
1.	Single-cycle magnetic amplifiers	267

## Elements of Automatic Control Systems (Cont.)

507/207		
2.	Push-pull (reversible) magnetic amplifiers	357
3.	Voltage amplifiers (magnetic modulators)	343
4.	Multivibrator and polyphasic amplifiers	350
5.	Contactorless magnetic relay amplifiers	253
6.	General information on the design of magnetic amplifiers	256
7.	Determination of design parameters of magnetic amplifiers	26
8.	Characteristics of magnetic amplifiers and methods of decreasing it	369

## Ch. VIII. Dynamoelectric Amplifiers

373		
1.	Separately-excited dynamoelectric amplifiers	358
2.	Self-excited dynamoelectric amplifiers	356
3.	Amplifiers	412

## Ch. IX. Inductive and paramagnetic amplifiers

412		
1.	Particulars of inductive amplifiers	412
2.	Particulars of paramagnetic amplifiers	462
3.	Variable paramagnetic amplifiers	470

## 4. Jet-type parametric amplifiers

470	
-----	--

## SECTION III. CONTROL ELEMENTS

483	
-----	--

## Ch. XI. Control Elements Using D-C Motors

483		
1.	General information	483
2.	D-C motor	503
3.	Operation of a "series" or with a control motor as a load	508
4.	Operation of an amplifier with a control motor as a load	510
5.	Controlling the operation of a self-excited d-c motor by varying the field	513

## Ch. XII. Control Elements Using Two-phase Induction Motors

511		
1.	Operation of a two-phase induction motor processes	511
2.	System of equations describing physical processes in a two-phase induction motor	516
3.	Torque of a two-phase induction motor	514
4.	Static characteristics of a two-phase induction motor and their use in determining parameters $K_d$ , $K_a$ , $f_d$ , $f_a$	548
5.	Effect of parameters of external circuits on static characteristics of a two-phase induction motor	553
6.	Transfer function of a two-phase induction motor	557
7.	Attenuation-frequency and phase-frequency characteristics of a two-phase induction motor	563
8.	Using an amplitude-modulated signal through an element having a transfer function $G(p)$ in a servomechanism having an open-loop system using a two-phase induction motor for any frequency $G(p)$	567
9.	Principle of operation and construction of a quick-response reversible electromagnetic clutch	570

## Ch. XIII. Electric Control Using Electromagnetic Clutches

573		
1.	Dry-friction electromagnetic clutches	573
2.	Visco-friction electromagnetic clutches	584
3.	Electromagnetic slip switches	595
4.	Principle of operation and construction of a quick-response reversible electromagnetic clutch	597

## Ch. XIV. Hydraulic and Pneumatic Control Elements

600		
1.	Hydraulic control elements	600
2.	Pneumatic elements with volume control	652
3.	Pneumatic control elements	673

## Ch. XV. Servomechanisms and the Evaluation of Their Characteristics

679		
1.	Basic indices for evaluating servomechanisms	679
2.	Speed of a servomechanism	684
3.	Accuracy of a servomechanism	686
4.	Additional indices for evaluating servomechanisms	686

TITLE: Optimization of automatic control systems and theory of K(D) representation

PERIODICAL: Akademiya nauk SSSR. Doklady, v. 144, no. 6, 1962, 1249-1250

TEXT: The optimization of automatic control systems, i.e., the finding of a function  $\Phi_{opt}$  involving minimum difference between the desired and achieved values of the state of the system is considered. It is shown that such an optimum system (N. Wiener, Extrapolation, Interpolation and Smoothing of Stationary Time Series, N. Y. - London, 1949) can be got by imposing the condition of K(D) representation,  $\Phi_{opt}(D)f(t) = 0$  with  $\Phi_{opt} \neq 0$  and  $f(t) \neq 0$  ( $f(t)$  - perturbation). This representation was introduced by V. S. Kulebakin (UMN, 6, no. 5, 211 (1951); DAN, 68, no. 5 (1949); 77, no. 2 (1951)).

automatic control systems

PERIODICAL: Akademiya nauk SSSR. Doklady, v. 148, no. 6, 1963, 1268-1270

TEXT: This paper is an attempt to reduce information theory and the  
theory of statistical optimization to the determination of invariance  
conditions. An automatic control system (ACS) is symbolized by the  
following graph:

For such a system the equation of information reads

Card 1/2

Information conditions for the ...

S/020/63/148/006/005/023  
B112/B186

$$\mathcal{H}_2(\xi') = \mathcal{H}_1(\xi) + \frac{1}{2W} \int \log |\Phi(j\omega)|^2 d\omega. \quad (2)$$

Some consequences are derived from the condition of absolute invariance. In particular, it is shown that each Wiener optimum system can be determined by means of the theory of invariance. There is 1 figure.

TOPIC TAGS: automation, automatic control systems, automatic controller classification, static linearization, designing complex automation

PURPOSE AND COVERAGE: This is the fourth volume of the handbook: "Instrument manufacture and automatic control devices." It consists of two parts. Part one presents the fundamentals and definitions of the theory of automatic control, modern methods of mathematical analysis and synthesis of linear and nonlinear systems, and the methods of their dynamic computation. The second part of

Card 1/4

L 50185-65  
AM5015052

the volume contains descriptions of typical electrically, pneumatically, and hydraulically operated controllers, actuating mechanisms, and control systems. It also gives basic technical characteristics of electronic computational techniques applied in automation, and elucidates problems of the organization and planning of the most widely used systems of automatic control.

TABLE OF CONTENTS [Abridged]:

- Part I. Theory and methods of designing automatic control systems
1. Fundamental principles, structure of systems, and a definition of the theory of automatic control (Ye. G. Izvol'skiy, L. G. Novogranova, and V. V. Glukhov) -- 1-18
  2. Objects of automatic control (Yu. Ya. Russkiy) -- 23-34
  3. Elements of automatic controllers -- 38-132
  4. Automatic controllers (Yu. Ya. Russkiy) -- 145-176
  5. Methods for calculating the dynamics and the statics of SAR (system of automatic regulation), the SAC (system of automatic control) and servosystems (L. G. Nogranova and V. V. Glukhov) -- 176-230

ABSTRACT: The authors consider the invariance of automatic regulation systems in the presence of perturbations which are specified specifically. The invariance conditions obtained on the bases of K(D) transforms are generalized to include the case of statistically specified perturbations. For stationary automatic control systems and stationary perturbations, the conditions of the K(D) transforms with respect to the perturbation turn out to be equivalent to the condition of K(D) transforms with respect to its correlation function. A new principle is proposed for constructing systems that are invariant with respect to continuous functions of the control signal, and ensure the absence of a statistical error. It is shown that when using an open cycle with variable structure it is possible to duplicate without statistical errors a broad class of functions of control action. The considered combined servomechanisms

with variable structure of open cycle are not very sensitive to changes within a certain range of system parameters. Examples of the use of the proposed construction principle of invariant systems are presented. Eight illustrations. Bibliography of 14 titles. V. M. [Translation of abstract]

ABSTRACT: The Third All-Union Conference on Invariance Theory and its Applications in Automatic Control Systems organized by the USSR and Ukrainian

Academies of Sciences, held in Kiev from 31 May to 4 June, was attended by some 500 scientists and engineers from the USSR, East Germany, Hungary, Poland, and Czechoslovakia. Papers were presented in the following sections: a) general problems of invariance theory; b) combined control systems; c) invariance in sampled-data control systems; d) invariance and sensitivity theory, invariant self-adjusting systems; e) nonlinear invariant systems; f) invariance in many-dimensional automatic control systems; g) application of invariance theory to moving objects; and h) industrial applications of invariant systems.

Card 1/4

L 04700-67

ACC NR: 46032581

The papers that were presented and the discussions showed that significant results were obtained in invariance theory. The methods of invariance theory were developed for many-dimensional continuous and sampled data systems (with the use of electronic digital computers). The conditions of controllability and observability in control systems were studied. The theory of many-dimensional invariant systems in the presence of random inputs was developed and a series of methods for synthesizing invariant multiloop systems were proposed. Definite progress was made in developing such trends as parametric invariance, sensitivity theory, and statistical dynamics. In particular, principles were developed for systems with double invariance.

The correlation between invariance theory and information theory was detected. The information characteristics of control processes were introduced on the basis of concepts of the entropy and recognition of processes. Invariance conditions in information form were obtained for the basic concepts of control regimes-stabilizing and reproducing, and equations for the compensation balance were derived in the form of entropy. The analogs of information theory were obtained for B. N. Petrov's two-channel principle and its features in common with the Shannon theorem concerning the direct and compensation information channels were indicated.

Card 2/4

L 04700-67  
ACC NR: AP6032581

The studies of self-adjusting systems with the aid of the invariance principle as well as of nonlinear invariant systems with a variable structure were extended. The possibility of increasing the accuracy of systems and of improving their dynamic and operational characteristics in the presence of large external disturbances was shown. Studies important to applications were carried out in the invariance theory-of systems with distributed parameters.

The essential difference between this conference and the previous ones is that an extensive analysis was made of designed and already operating automatic control systems. The effectiveness of the application of invariance principles to industry-wide automation and manufacturing of instruments was demonstrated. Realization of control in compound industrial complexes with the aid of electronic digital computers operating on the basis of compensating the disturbances was considered as an entirely new fact. The economic efficiency and reliability of such complex automation systems were estimated for one specific example (Slavyansk sodium plant).

Invariant control systems already operating in the petrochemical industry, metallurgy, construction, and transportation, and also in precision measuring and information systems were considered.

A great deal of attention was paid to papers dealing with development

Card 3/4

L 04700-67

ACC NR: AP6032581

and realization of invariant gyroscopic systems and control systems in flight vehicles. Development of methods for designing gyroscopic systems insensitive to disturbances and for stabilizing and controlling flight of vehicles in the presence of disturbances due to wind and under various external loads was considered as the central problem.

In the course of discussions, the question of realizability of invariance conditions in automatic control systems was considered. The necessity of developing invariance theory which could be applied to new fields of automation, including the theory of finite automata, was pointed out. [ATD PRESS: 5094-F]

TITLE: On the Classification and Denomination of the Science of the Seas

PERIODICAL: Izvestiya Akademii nauk SSSR, Seriya geograficheskaya, 1959, Nr 5, pp 98-100 (USSR)

ABSTRACT: At present there is no generally accepted classification and denomination of the science for the study of the World Ocean. The author proposes the name of "Oceanology" for this science. Up to now many names are used, such as oceanography, oceanology, sea hydrology, sea hydrometeorology, physics of the sea, or even (especially in foreign scientific literature) hydrography. The author cites the following scientists who introduced one of the above names: Yu.M. Shokal'skiy, G.R. Zhukovskiy, Yu.V. Istoshin, V.S. Nazarov, A.M. Muromtsev, V.A. Snezhinskiy, N.N. Zubov, A.P. Loydis, L.A. Zenkevich, N.V. Malinovskiy, V.G. Kort, B.A.

Title : Biological activity of alpha-aminophosphinic acids

Periodical : Dok. AN SSSR 98/5, 849-852, Oct 11, 1954

Abstract : The biological activity of alpha-aminophosphinic acids (toxic when in large concentrations), is discussed. The biological activity of these acids is best expressed in the inhibition of virus multiplication in the mosaic disease of tobacco. The effect of these acids and glycol on the titer of influenza virus in growing chicken embryos was investigated and the results are described. Eleven references: 7-USSR; 2-USA; 1-French and 1-German (1930-1953). Tables.
